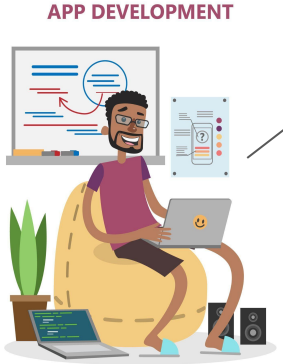
Docker

Agenda

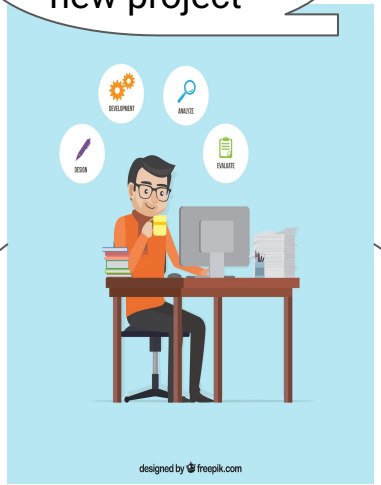
1. What is Docker?
2. Architecture of Docker
3. Example
4. Docker-compose
5. Exercise

WHY DOCKER ??

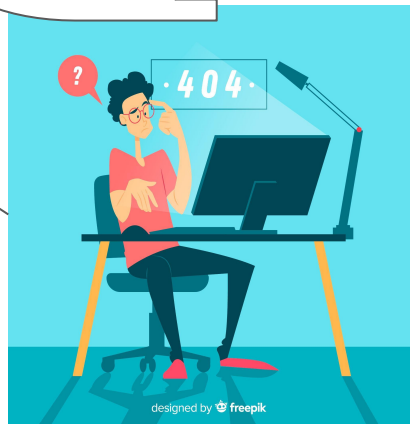
It's working in my system



Test out our new project



I'm facing an error

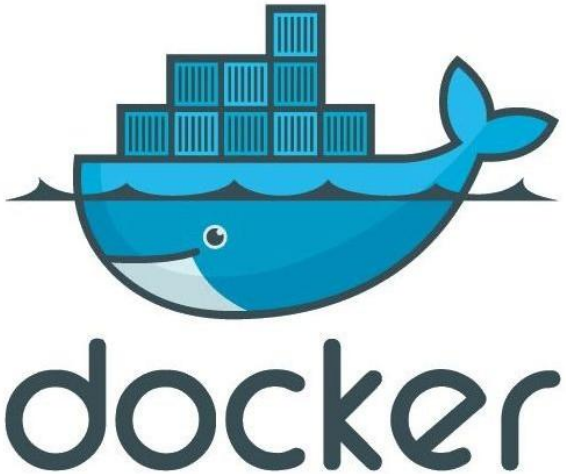


What is Docker?

- Docker is an open platform for developing, shipping, and running applications.
- Docker provides the ability to package and run an application in a loosely isolated environment called a container.

SHIPPING EXAMPLE

SHIPPING EXAMPLE



Docker Tools and Terms

- Docker file
- Docker images
- Docker containers
- Docker Hub
- Docker daemon
- Docker registry

```
FROM ubuntu:16.04

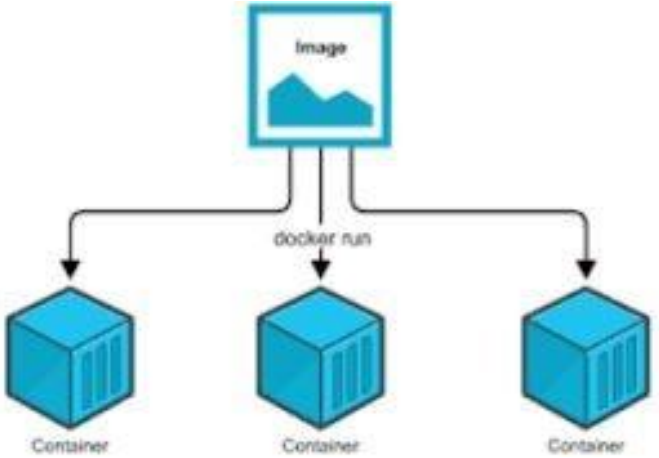
MAINTAINER Abhishek

RUN apt-get update
RUN apt-get install -y python3 python3-pip
COPY . /app

WORKDIR /app

EXPOSE 5000

ENTRYPOINT echo "Hello World !"
```



Docker architecture

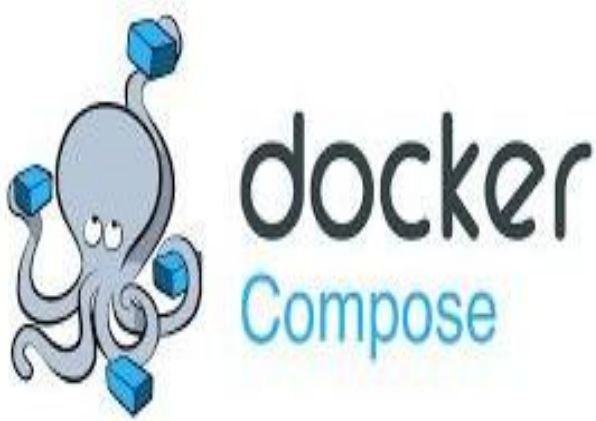
Docker-Compose

- Tool for defining and running multiple containers



Three steps

1. Define your app's environment with a `Dockerfile`.
2. Define the services that make up your app in `docker-compose.yml`
3. Run `docker compose up` and the Docker compose command starts and runs your entire app.

Steps to create docker compose file

Step 1: Install docker engine
https://docs.docker.com/engine/install/ubuntu/
Step 2: Create docker compose file at any location on your system

docker-compose.yaml

Step 3: Run docker-compose.yaml file by command:

docker compose up -d

Step 4: Bring down application by command:

docker compose down

INSTALLATION

Step 2: To manage Docker as a non-root user

sudo usermod -aG docker $USER

docker ps

To verify the installation enter the following command

docker --version

CHEAT SHEET

BASIC COMMANDS

CONTAINERS

#To Run A Container
$ docker run < image name >

#To Start A Container
$ docker start <container name>

#To Stop A Container
$ docker stop <container name>

Restart A Container
$ docker restart <container name>

To list running Containers
$ docker ps

To Remove A Container
$ docker rm <container name>

Execute Command Inside Container
$ docker exec <container_name> <command>

Get Into A Container
$ docker exec -it <container_name> bash

Get Logs Of A Container
$ docker logs <container_name>

IMAGES

#To Pull An image from repository
$ docker pull < image name >

#To List Image Digest
$ docker images

#To Remove Image
$ docker rmi <image name>

To Build Image From Dockerfile
$ docker build -f < Dockerfile >

Reminder

If You Have Installed Docker and Docker-compose using sudo , then

$ sudo <command>

DOCKER CLEANUP

#Delete all stopped containers
$ docker container prune

#Delete All Unused Images
$ docker image prune

#To clear entire docker
$ docker system prune

DOCKER COMPOSE

#To Create & Run Containers
$ docker-compose -f <yaml file> up

#To stop & Remove Containers
$ docker-compose -f <yaml file> down

THANK YOU
